RFT-20Y Series

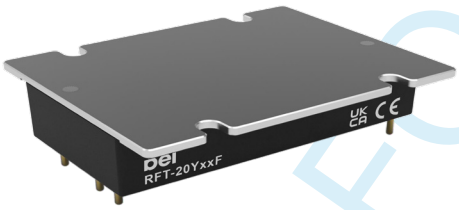

20 W Isolated DC-DC Converter

Not Recommended for New Design
Suggested replacement:
PRFE20W-D Series

NOT FOR NEW DESIGN

The RFT-20Y Series is a high-performance product, specifically designed for a variety of railway applications. The DC-DC converters feature 20 W single output voltage, wide input voltage from 14 - 160 VDC and extended operating temperature range from -40 to 105°C.

Additional product features include input under-voltage protection, output over-voltage, short-circuit, over-current and over-temperature protection and output voltage trim adjustment. The products are widely used in railway systems and associated equipment.

Key Features & Benefits

- Ultra-wide 12:1 input voltage range: 14 – 160 VDC
- High efficiency up to 90%
- Reinforced insulation, I/O isolation test voltage 3 kVAC
- Operating ambient temperature range -40 °C to +105 °C
- Input under-voltage protection, output over–voltage, over-current, short-circuit protection, over-temperature protection
- Industry standard 2" x 1" package and pin-out
- Meets EN 50155 and AREMA standard
- Safety approved according to IEC 62368-1 & UL/CSA 62368-1

Applications

- Railway related equipment

9.2 TYPICAL APPLICATION

1. Please ensure that at least a 100 µF electrolytic capacitor is connected at the input in order to ensure adequate voltage surge suppression and protection.
2. Output ripple can be further reduced by appropriately increasing the output capacitor values C2/C3 and/or by selecting capacitors with a low ESR (equivalent series resistance). Also make sure that the capacitance is not exceeding the specified max. capacitive load value of the product.
3. Recommended circuit for Ctrl negative logic refer to Fig. 4.

9.3 TRIM FUNCTION FOR OUTPUT VOLTAGE ADJUSTMENT (open if unused)

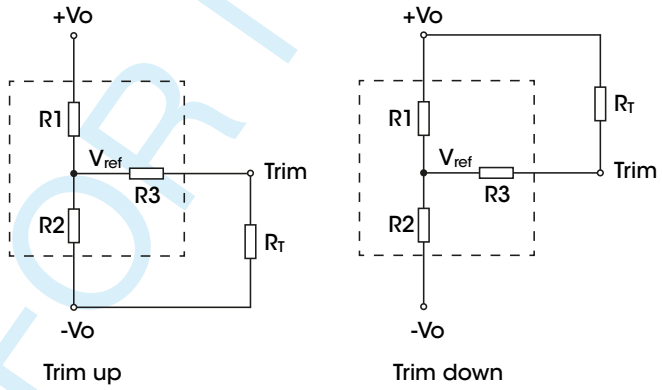

Figure 5. Trim resistor connection (dashed line shows internal resistor network)

Calculation formula of Trim resistance:

$$\text{Trim up: } R_T = \frac{a * R_2}{R_2 - a} - R_3 \qquad a = \frac{V_{ref} * R_1}{V_O - V_{ref}}$$

$$\text{Trim down: } R_T = \frac{b * R_1}{R_1 - b} - R_3 \qquad b = \frac{(V_O - V_{ref}) * R_2}{V_{ref}}$$

NOTES:

a, b : Self-defined parameter, round to the nearest hundredth
R_T [kΩ] : Resistance of Trim
V_O : Output voltage change
